MYNIC ties up with AG Projects

Signs MOU for knowledge and technology sharing

With more and more people going online, there is a need to focus on the integration the traditional PSTN technologies together with that of Internet technologies. MYNIC's MOU with AG Projects is a step in that direction.

MYNIC the providers of Internet Registry and Addressing Services in Asia Pacific, has signed a Memorandum of Understanding (MOU) with AG Projects from the Netherlands for knowledge sharing and technology transfer on the research of Telephone Number Mapping (ENUM) in Malaysia.

According to MYNIC's Director, Pn. Shariya Haniz Zulkifli, the MOU is part of MYNIC's plan to strengthen the agency's research arm to bring forth technological innovation in the field of ENUM.

ENUM is a protocol that provides a translation mechanism for E.164 telephone numbers into IP addressing schemes. Based on standards endorsed by IETF (Internet Engineering Task Force) and ITU (International Telecommunication Union), ENUM is the key ingredient of the convergence between PSTN (Public Switch Telephone Network) and the Internet.

"The worlds of IT and telecommunications are getting more and more integrated. These two worlds will one day become one. As such, MYNIC has taken the initiative to be on the lookout for technological solutions that

can meet the challenges of such imminent integration and ultimately enabling MYNIC to offer better services to our customers," added Shariya.

AG Projects is a software vendor specialized in serving companies like cable operators and Internet service providers. The company focuses on the delivery of SIP infrastructure that complements fiber to the home deployments, triple-play and converged fixed/mobile communication services.
